Preliminaries

1.1 基本的な表記

量子化 (quantifier) の束縛をコンマ (,) で続けて書く。束縛の終わりをピリオド (.) で示す。例えば,

$$\forall x_1 \in X_1, x_2 \in X_2. \exists y_1 \in Y_1, y_2 \in Y_2. x_1 = y_1 \wedge x_2 = y_2$$

は,

$$\forall x_1 \in X_1. \forall x_2 \in X_2. \exists y_1 \in Y_1. \exists y_2 \in Y_2. x_1 = y_1 \wedge x_2 = y_2$$

と等しい。また, 量子子の束縛において, *such that* を省略し, コンマ (,) で繋げて書く。例えば,

$$\forall x \in \{0, 1\}, x \neq 0. x = 1$$

は,

$$\forall x \in \{0, 1\}. x \neq 0 \implies x = 1$$

と等しい。また, \implies , \iff が他の記号と混同する場合, それぞれ *implies*, *iff* を使用する。

集合 (*set*) について, 以下の表記を用いる。

- 集合 A について, その濃度 (*cardinality*) を $|A|$ と表記する。なお, A が有限集合 (*finite set*) の時, 濃度とは要素の個数のことである。
- 集合 A について, $a \in A$ を $a : A$ と表記する。
- 自然数 (*natural number*) の集合を $\mathbb{N} = \{0, 1, \dots\}$ と表記する。また, n 以上の自然数の集合を $\mathbb{N}_{\geq n} = \{n, n+1, \dots\}$ と表記する。
- 自然数 $n \in \mathbb{N}$ について, $\{1, \dots, n\}$ を $[n]$ と表記する。
- 集合 A の冪集合 (*power set*) を $\mathcal{P}(A) = \{X \mid X \subseteq A\}$, 有限冪集合を $\mathcal{P}_{fin}(A) = \{X \in \mathcal{P}(A) \mid X \text{ は有限集合}\}$ と表記する。
- 集合 A_1, \dots, A_n の直積 (*cartesian product*) を $A_1 \times \dots \times A_n = \{(a_1, \dots, a_n) \mid a_1 \in A_1, \dots, a_n \in A_n\}$ と表記する。集合 A の n 直積を $A^n = \underbrace{A \times \dots \times A}_{n \text{ 項}}$ と表記する。特に, $A^0 = \{\epsilon\}$ である。
- 集合 A_1, \dots, A_n の直和 (*disjoin union*) を $A_1 \uplus \dots \uplus A_n = (A_1 \times \{1\}) \cup \dots \cup (A_n \times \{n\})$ と表記する。なお, 文脈から明らかな場合, 直和の添字を省略し, $a \in A_i$ に対して, $a \in A_1 \uplus \dots \uplus A_n$ と表記する。
- 集合 A の B との差集合 (*relative complement*) を $A \setminus B = \{a \in A \mid a \notin B\}$ と表記する。

- 列 $\alpha = \sigma_1 \dots \sigma_n \in \Sigma^*$ について, その長さを $|\alpha| = n$ と表記する。

という表記を導入し, 関係 $f : A \rightarrow B$ を A から B への部分関数 (*partial function*) と呼ぶ。さらに,

$$A \rightarrow B \stackrel{\text{def}}{=} \{f : A \rightarrow B \mid \forall x \in A. \exists y \in B. (x, y) \in f\}$$

という表記を導入し, 部分関数 $f : A \rightarrow B$ を (全) 関数 (*function*) と呼ぶ。関係について, 以下の表記を用いる。

- 関係 $R \subseteq A \times B$ について, $(a, b) \in R$ を $a R b$ と表記する。
- 関係 $R \subseteq A \times B$ について, 定義域 (*domain*) を $\text{dom}(R) = \{a \mid \exists b. (a, b) \in R\}$, 値域 (*range*) を $\text{cod}(R) = \{b \mid \exists a. (a, b) \in R\}$ と表記する。

- 部分関数 $f : A \rightarrow B$ について, $(a, b) \in f$ を $f(a) = b$ と表記する.
- 関係 $R_1 \subseteq A \times B$, $R_2 \subseteq B \times C$ について, その合成 (composition) を $R_1; R_2 = R_2 \circ R_1 = \{(x, z) \in A \times C \mid \exists y \in B. (x, y) \in R_1, (y, z) \in R_2\}$ と表記する.
- 関係 $R \subseteq A \times B$, 集合 $X \subseteq A$ について, R の X による制限 (restriction) を $R \upharpoonright_X = \{(a, b) \in R \mid a \in X\}$ と表記する. 特に関数 $f : A \rightarrow B$ の $X \subseteq A$ による制限は, 関数 $f \upharpoonright_X : X \rightarrow B$ になる.
- $a \in A$, $b \in B$ について, その組を $a \mapsto b = (a, b)$, 関数 $f : A \rightarrow B$ を $f = x \mapsto f(x)$ と表記する.
- 2 項関係 $R \subseteq A^2$ について, その推移閉包 (transitive closure), つまり以下を満たす最小の 2 項関係を $R^+ \subseteq A^2$ と表記する.
 - 任意の $(a, b) \in R$ について, $(a, b) \in R^+$.
 - 任意の $(a, b) \in R^+$, $(b, c) \in R^+$ について, $(a, c) \in R^+$.
- 2 項関係 $R \subseteq A^2$ について, その反射推移閉包 (reflexive transitive closure) を $R^* = R^+ \cup \{(a, a) \mid a \in A\}$ と表記する.

定理 13 (Respect Evaluation). $e_1 \equiv e_2 : \tau$ の時, $e'_1 \Rightarrow^* e_1$, $e_2 \Rightarrow^* e'_2$ ならば $e'_1 \equiv e'_2 : \tau$. □

系 14. $e_1 \equiv e_2 : \tau$ の時, $e_1 \Rightarrow^* e'_1$, $e_2 \Rightarrow^* e'_2$ ならば $e'_1 \equiv e'_2 : \tau$. □

証明. $e_1 \Rightarrow^* e_1$ より, 定理 13 から $e_1 \equiv e'_2 : \tau$. よって, T-Sym から $e'_2 \equiv e_1 : \tau$ であり, $e'_2 \Rightarrow^* e'_2$ より定理 13 から $e'_2 \equiv e'_1 : \tau$. 故に, T-Sym から $e'_1 \equiv e'_2 : \tau$. ■

8.2 HM(X): HM Type System with Constraint System

[OSW99]

8.2.1 制約システム

定義 42 (単純制約システム (simple constraint system)). 単純制約システムとは、以下の組 (Ω, \Vdash) のこと。

- 非空のアルファベット Ω .
- 関係 $(\Vdash) \subseteq \mathcal{P}(\Omega) \times \Omega$ で、以下を満たすもの。
 - 任意の $C \in \mathcal{P}(\Omega)$, $P \in \Omega$ について, $C \Vdash P$.
 - 任意の $C, D \in \mathcal{P}(\Omega)$, $Q \in \Omega$ について, $(\forall P \in D. C \Vdash P)$ かつ $D \Vdash Q$ ならば $C \Vdash Q$.

この時, $C \in \mathcal{P}(\Omega)$ を制約 (*constraint*) と呼ぶ。また, $(\Vdash) \subseteq (\mathcal{P}(\Omega))^2$ への拡張を, $C \Vdash D \stackrel{\text{def}}{\iff} \forall P \in D. C \Vdash P$ と定義する。 $C \Vdash D$ かつ $D \Vdash C$ の時, $C \dashv\vdash D$ と表記する。さらに, $C \wedge D = C \cup D$ と表記する。 \square

命題 43. 単純制約システム (Ω, \Vdash) は、以下を admissible にする。

$$\frac{\overline{C \Vdash C}}{C_1 \Vdash C_2 \quad C_2 \Vdash C_3} \quad \frac{C_1 \Vdash C_3}{C \Vdash D} \quad \frac{C \Vdash D}{C \wedge C' \Vdash D}$$

Machine

State:

- a rule
- current position in rule

Transition:

- σ
- EOS
- otherwise

Output:

with backpoint バックポイントを設置し、バックポイントに戻った時の次の遷移を指定する。fail した場合一番直近の **backpoint** まで入力状態とスタックを戻す。reduce 時取り除かれる。
enter 非終端記号を参照する。メモ化されている場合その値を使う。それ以外の場合、reduce 時戻ってくる状態を記録し、次の状態に遷移する。
goto 次の状態に遷移する。
shift 入力を 1 つ消費し、次の状態に遷移する。
reduce 規則に沿ってスタックから要素を取り出してまとめ、メモし、スタックに新たに入れた後、enter 時に記録された状態に遷移する。

Optimization

1. unify transitions.
2. look ahead backpoints.
